

# Alarm signalling is changing

## Upgrade your digi-communicators

Upgrade your customer's digi-communicator alarm signalling to BT Redcare's Next Generation products and give them future-proofed monitored protection.

As we move towards all-IP, the traditional analogue phone lines will be migrated to a new digital service between now and 2025. As digi-communicators rely on traditional phone lines, homes and businesses could be left without protection if action isn't taken to future proof their alarm signalling before they move across to the new digital network.

### Future-proofed

Essential and Essential IP are the perfect fit for the new digital service your customers will be moving to.

### Cut down on costs

With no call costs.

### Faster response times

They send signals in seconds and report path faults to the alarm receiving centre within 60 minutes, exceeding SP2 performance, much quicker than your customer's current signalling.
