

4 G4S Security Systems

Introducing G4S Security Systems

G4S provides installation, maintenance and monitoring of security systems – including intrusion, video, access and fully integrated electronic security solutions - to help protect your premises, assets and keep your people safe.

With over 50 years of experience in Ireland, we have become a trusted partner to those who require the best possible security system, delivered on time and within budget.

The G4S Advantage: Why Partner With Us?

We combine global expertise with local presence to deliver unparalleled service and peace of mind.

Nationwide Coverage, Local Expertise

With a network of engineers and offices across Ireland, we provide a rapid, local response whenever you need it.

Unmatched Experience & Trust

Our accreditations are your guarantee of quality. We are the trusted security partner for thousands of businesses, including leading blue-chip companies.

Expert, Vetted Professionals

Our team consists of highly skilled, security-cleared engineers who undergo continuous professional development to stay ahead of the latest technologies and safety legislation.

Cutting-Edge Technology

Through strategic partnerships with leading global manufacturers, we provide access to the most advanced and reliable security technology on the market, ensuring your solution is both effective and future-proof.

Understanding your market

From busy construction sites to datacentres, our clients operate in a variety of sectors, each with their own unique risks and challenges.

We see them, and we understand the importance of designing technology solutions that best fit the environment in which they are deployed to protect.

Quality and consistency

When purchasing an electronic security solution on behalf of your business, you're not just investing in the video, access, intrusion or fire protection hardware that will eventually be installed.

The part of your investment that matters most lies in the people and processes responsible for creating an efficient solution that delivers excellence at every stage - from project inception to installation through to ongoing maintenance and life cycle management.

Prefabrication, testing and programming

Takes place in a controlled environment for efficient plug and play installation on site.

Technical support and troubleshooting

We provide best in class post sales support to optimise your investment and ensure equipment is in optimum working order.

Communication and documentation

Technical documentation sets are created, compiled and customised for every client.

Technology evaluation and product auditing

Working with leading security manufacturers to evaluate new products and influence innovation in the industry.

Technical training and toolbox talks

Giving our teams access to compliance updates and product-specific training.

What this means for you

- ✓ On site installations are more efficient
- ✓ Higher quality of engineering workmanship
- ✓ Out of the box equipment failures are minimised
- ✓ Inconsistencies in deployment are reduced
- ✓ Asset, service and support documentation is streamlined
- ✓ Your overall solution becomes more cost-effective

Our Core Security Solutions

Our portfolio includes:-

Advanced Access Control

Manage exactly who goes where and when. From a single door to a complex, multi-site global network, our systems provide complete control. We offer solutions for every operating environment.

CCTV & Intelligent Surveillance

Maintain a constant, vigilant watch over your premises. We offer a full range of surveillance options, from single cameras to sophisticated networks with intelligent video analytics. For ultimate protection, our state-of-the-art Security Operations Centre (SoC) can monitor your site 24/7.

Intruder Detection

Protect your people, assets, and property with customised alarm systems designed for any risk level. Monitored 24/7 by our accredited SoC, our systems ensure a fast, reliable response and meet the stringent requirements for police URNs (Unique Reference Numbers).

Access Control

Access control lets you verify visitors, protect your team, and secure sensitive areas of your business. Our range of access systems not only enhances security but also provides valuable insights into building occupancy. Movement and suspicious activity.

Our access management platforms allow you to precisely manage who can enter your premises, open a specific door, or access a particular area. From electronic locks and intercoms in door entry systems to gates, barriers, turnstiles, and advanced biometric technology, there's a solution for every need.

Maintaining control over who enters your building, when, and where they can go is crucial. Without robust access control, your people, assets, and intellectual property face unnecessary risks.

What's more our platforms ensure a modern and positive interaction - balancing security and experience.

Beyond security, the data generated by our access control software offers valuable insights into how different areas of your buildings are being utilized daily.

Intruder Detection

Safeguarding your property from break-ins demands robust intrusion detection and monitoring. We offer proven solutions that help businesses of all sizes minimize losses and enhance the security of their premises and perimeters.

Intrusion Detection Systems (IDS) use electronic technology to deter, detect, and prevent unauthorized entry by intruders, burglars, and trespassers. While commonly used to protect individual buildings and their contents – especially when unoccupied (like overnight or during holidays) – there are various types of IDS available.

For larger sites or extensive perimeters, Perimeter Intrusion Detection Systems (PIDS) provide specialized technologies to secure the boundaries.

Video Surveillance

Video surveillance is a powerful tool for deterring threats, constant monitoring, and swift response. With our extensive expertise in video solutions, we help organisations businesses maximize the value of today's most advanced video technology.

Modern security surveillance offers far more than just a watchful eye. Gone are the days of manual monitoring, bulky cameras, and blurry images. Today, the benefits of video over IP are revolutionizing the security industry. The latest CCTV systems for business and public safety boast superior features, from crystal-clear High Definition (HD) image quality to powerful deep learning Artificial Intelligence (AI).

We partner with leading video surveillance manufacturers and software developers to help our clients harness these innovations. Our services include expert design and installation, comprehensive maintenance and monitoring, and advanced system integration. Our solutions are designed with your operating environment and control room staff in mind.

Delivering Your Project

End-to-end project delivery and service capability

We use clearly defined processes to ensure your system is installed successfully, on time and operates in optimum fashion throughout the duration of your relationship with us.

Project Management

As with any project, the successful delivery of security system projects and integration requires careful planning, organization, and control.

We have a team solely focused on these functions, bringing together experienced people who know exactly what it takes to navigate complex projects and guide them to completion. This strength in our people and preparation helps us deploy advanced technology in challenging environments for market-leading clients.

We also understand that every project is unique. While requirements can evolve and timelines can change, the standard of security system should never waver from the high standards you expect.

Our comprehensive suite of associated procedures, processes, and documentation robustly supports our structured and compliant coordination of security and fire safety projects.

We'll work to ensure all dependencies and enabling works are clearly identified pre-commencement to mitigate any supply chain risk. All stakeholders will have clear lines of communication up and down the chain, with regular updates to keep the project on program and on track. Our Project Managers are familiar with and utilize Prince2 procedures, and based on our experience with similar projects, we'll include the appropriate level of management to execute the works in line with all important regulations throughout all project phases.

Installation

Once you've approved our proposal, your order will be processed and passed to our dedicated installations team to agree on a suitable date and time for your system installation.

On the day, our engineers will come to your premises to carry out the installation. They'll engage with key stakeholders on-site to ensure minimal disruption to your employees, customers, and visitors. The time required to install and commission your systems will vary depending on the system's size, the labor needed, and the level of advanced integration.

After your system has been fully installed, tested, and commissioned, you'll receive a complete demonstration on how to use it. Our engineers will be on hand to answer any questions and ensure daily users are comfortable with its operation and understand how to contact us for further support.

Maintenance

Electronic products, systems, and devices can only perform successfully if their parts and components remain in good working order.

Without regular maintenance, technical faults can occur over time, preventing them from doing their job.

Security Systems are no different; should they fail to operate as expected, you could be left exposed to risks that could compromise the safety of your people and property as well as being in breach of insurance requirements.

We offer a choice of maintenance packages that each include the essential preventative service checks and ongoing support your systems need to run at optimum levels. Whether you choose a new G4S solution or would like us to take responsibility for your existing life safety equipment, we'll recommend the most appropriate maintenance package to suit your specific and long-term needs.
